The footbed

Birki's footbeds – anatomic, fashionable, comfortable

Birki Schuh GmbH has set itself the target to make the renowned pleasant and healthy wearing comfort a real experience for everyone: for adults and children, women and men, demanding trendsetters, and, and, and. The anatomic footbed, firm element of all Birki styles, perfectly adjusts to the foot with every movement.

In doing so Birki Schuh GmbH offers its customers three varieties of the classic anatomically moulded footbed: with cork-latex centre, with cork-latex centre as Soft Footbed and as ALPRO®-foam footbed.

The Classic: The footbed with cork-latex centre

The footbed is made up of four different layers and last but not least the ALPRO®-cell bottom sole. The foot is tenderly pampered by the suede leather liner. This is placed on top of the first jute layer and the anatomically moulded cork-latex centre. Both suede liner and jute layer are indispensable forwarders of moisture which is generated when walking and running. Moreover, they stabilise the footbed and are a warrant for pleasing comfort with every step. A second jute layer which stabilises the footbed towards the bottom follows suit. Just as important as the high quality natural raw materials are the functional properties of the anatomic form. The toe bar encourages the intensive gripping motion of the toes with every step. Longitudinal and cross arch supports keep the foot flexibly aligned inside the footbed as does the deep heelcup. The footbed rim is cut high in order to protect the toes and the heel area well. This way even longer journeys on foot can now be tackled.

For lovers of soft well-being: Soft Footbeds with cork-latex centre

Birki's Soft Footbed is made up similar to the Classic. However, there is an essential but immediately noticeable difference: the core of the footbed is a permanently elastic latex cushion inserted directly underneath the suede leather liner. This way the impact of each step is absorbed even better. The latex cushion is size-adjusted – soft, flexible and comfortable.

For aquatic athletes and relaxation artists: footbeds made of ALPRO®-foam

ALPRO®-foam footbeds are also anatomically moulded. In this case, however, the flexible and particularly adaptable ALPRO®-foam blend is exclusively used and turns these shoes into ideal companions for all applications in and around water. ALPRO®-foam is insensitive to water and due to its special tread texture it can also be used on smooth surfaces. Of course the form also has a positive effect on comfort so that you can enjoy your days at the beach, the sauna, or a wellness oasis in an even more relaxed way.

No matter the purpose that requires a comfy cozy footbed: Birki's developments and ideas leave nothing to be desired!

Functional sandals and clogs in modern design – that's what the name Birki's has been standing for since 1993. As licensee of Birkenstock Orthopädie GmbH & Co. KG, Birki Schuh GmbH can look back on more than 230 years of experience in shoe manufacturing. The anatomic footbeds of the Birki styles perfectly adjust to the foot and support the natural step formation even during extended periods of walking and standing. Special production methods allow for the production of very light and extremely durable sandals and clogs. Due to the combination of innovative polymers with natural materials Birki's can be employed in a variety of different areas, like sauna, pool, spa, hotel, kitchen, hospital, garden, holiday, leisure, etc. The terms "anatomically moulded" and "highly developed" best summarise all Birki's collections to date.
